Multi Resolution / Orientation

- Create a Layout for both Portrait & Landscape

Create a Layout for both Portrait & Landscape
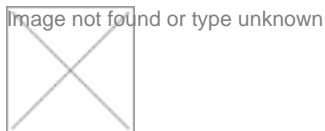

First, make a new layout: Layouts > Add New

Next, complete the Layout settings by giving it a Name, selecting the resolution(s) and orientations:

Now choose the Template you want to start building your layout from (default is blank) and click 'Save & Continue to Builder' located top right

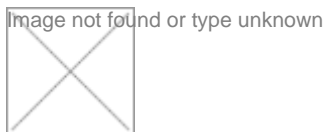

At the top of the layout builder, select the orientation you want to design for. For this example, we have selected Landscape:

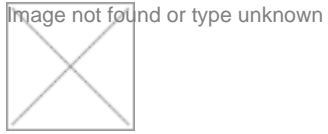

Now add content via pages, zones and playlist items. We've added a text item and added some basic formatting.

To design this content for Portrait, we simply select the drop down for orientation at the top of the layout and select 'Portrait':

We can now edit the zone size and position as well as the formatting of the text item in portrait orientation to be different to that of landscape:

Image not found or type unknown

Continue to do this for all other zone content to optimise each orientation design so the same content can be used for both portrait and landscape.
